

Suspension Technique Jointless with multicell hooks

Cross section

Most Louverlux aluminium louvers can also be installed seamlessly, i.e. the connection between the louver panels is as invisible as possible.

In this case, the louvre panels are butted together with half a web overlap all round and secured with connecting clips to maintain parallelism.

In the suspension technique with Multicell hooks, the grid panels are drilled in all 4 corners and the fastening hooks are then inserted into these.

The fixing hooks in turn are suspended from the support profile above.
